

Task 1 – Project Proposal Consolidation

Primary Owner – Mustafa Mahmoud

EgySpy – Consolidated Project Proposal

Baseline v1

1. Background

Employee attendance records typically confirm an employee's presence at the time attendance is recorded, but they do not provide continuous visibility into the employee's movement during working hours.

EgySpy aims to provide continuous monitoring of employee movement within a defined facility during working hours.

2. Problem Statement

Management lacks a reliable way to monitor employee movement after attendance has been recorded. This may allow employees to leave their assigned work areas or spend working hours in other locations without proper visibility.

It may also create opportunities for attendance manipulation and fraudulent attendance practices when attendance records do not accurately reflect an employee's actual presence during working hours.

3. Objectives

EgySpy aims to:

- Track employee movement within the facility in real time.
- Record the locations employees visit.
- Record the time employees spend at different locations.
- Identify movement that may be inconsistent with an employee's assigned work area.
- Reduce opportunities for attendance manipulation and fraudulent attendance practices.
- Support management monitoring and accountability.

4. Scope

In Scope

- Employee movement within the defined facility.
- Employee locations during working hours.
- Visited locations and time spent at each location.
- Assigned employee work areas or expected locations.
- Movement information required for management monitoring.

Scope Boundaries

- The system covers movement within the facility during working hours.
- The system does not determine whether an employee is actually performing their assigned work.
- The project is not a general attendance-management system; attendance is considered in relation to employee movement after attendance is recorded.
- Specific technologies, hardware, tracking methods, and system architecture are not defined at this stage.
- This phase covers planning and design only, not implementation.

5. High-Level Approach

EgySpy will collect employee movement and location information during working hours and associate it with the relevant employee and location.

The collected information will provide management with visibility into employee movement and help identify situations that may require attention.

The specific technology and implementation method will be determined during the design phase.

6. Assumptions

- Each employee has an assigned work area or expected location.
- The facility and working hours are clearly defined.
- Management requires employee movement information for monitoring and accountability.
- The selected solution will provide sufficiently reliable location and time information.
- Technology and system architecture will be selected during later design activities.
